Control arm bushings

to fit

BMW E28, E31, E32, E34, E39

After average mileage, many 5-series BMW drivers notice vibrations when steering. And possibly the whole front end might vibrate when braking and turning at the same time.

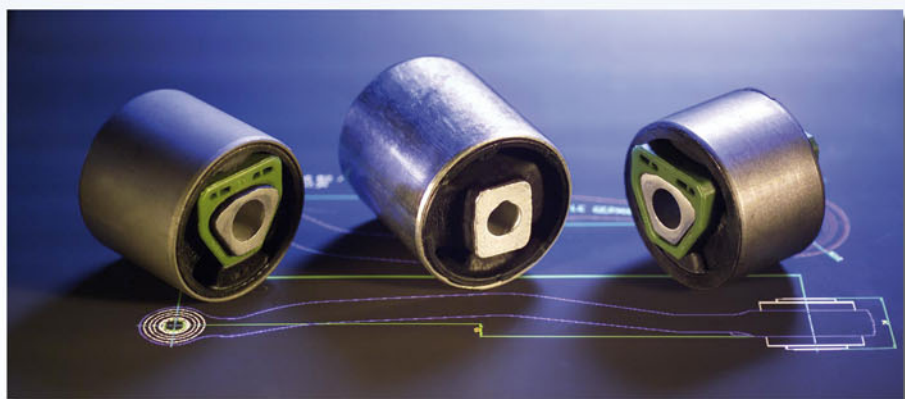

Repair shops, which do not frequently service the BMW 5-series will often balance the tires in such cases, replace the brake discs or align the front axle.

However, the considerably strengthened MEYLE control arm bushings permanently prevent the front axle from vibrating. Our engineers have succeeded in combining the positive characteristics of the different OE bushings to give the reinforced MEYLE bushings a wider application range.

These bushings are of course also fitted to the corresponding MEYLE control arms.
